1. General overview of the study series Destination Brand

The following overview is an excerpt from a detailed, scientifically founded presentation of the Destination Brand study series by the authors Prof. Dr. Bernd Eisenstein, Alexander Koch, Dr. Petra Trimborn and Sylvia Müller. It appeared in the edited volumes on market research for destinations published by Prof. Dr. Bernd Eisenstein in 2017 (for more information see chapter 8.4 in the appendix).

The Destination Brand study series has provided information on the perception of more than 130 destinations in every year since 2009. As branding gained in importance in strategic management of tourist destinations, there was an increasing demand for empirical data that supports competitive strategies of tourist destinations. As a touristic market research instrument, the study series provides a unique contribution to the comparative summary of the demand-side perceptions of destination brands. The study series consists of three separate, thematic modules, which each highlight a specific focus of the destination brands as individual studies.

The theoretical starting point and conceptual basis of the study series is the concept of identity-based brand management. The concept of identity-based brand management (see the following figure) considers both the brand's internal self-reflection from the supplier's perspective (brand identity) and the external brand perception from the perspective of the demand (brand image). So far, the Destination Brand study series focuses primarily on the perception of tourist destination brands from the perspective of the demand.

The professional management of a destination brand requires knowledge of the demand-side perceptions of the brand. Today, it is almost impossible to introduce and further develop a competitive destination brand without having empirical information on the brand image² of the destination.

The basic requirement for the generation of a brand name's impact is that the brand has a (target group-specific) level of awareness. In other words, it has reached the consciousness of potential customers (brand awareness, see following figure). This is where the first of the three Destination Brand studies comes in: it measures the awareness of destination brands in the context of the four dimensional brand funnel analysis.

The second and third studies in the series are aimed at determining the **benefit dimensions of the destination** brands: the key to successful brand building, as defined by the achievement of a dominant position in the consumer's psyche and differentiation from its competitors, is the formulation of a value proposition by which the brand³ is positioned on the market.⁴ In the course of this positioning, it is important to consolidate the brand identity into a bundle of benefits that clearly focuses on a few consumer-related and purchase-relevant benefit dimensions, taking into account both the functional and the emotional-symbolic benefit dimensions. This also applies to destination brands: The image of the destination brand is created from the associated benefits that are connected by the potential guests with the respective destination.⁵

Since 2009 annually: Information about the perception of more than 130 destination brands

Theoretical starting point: concept of identity-based brand management

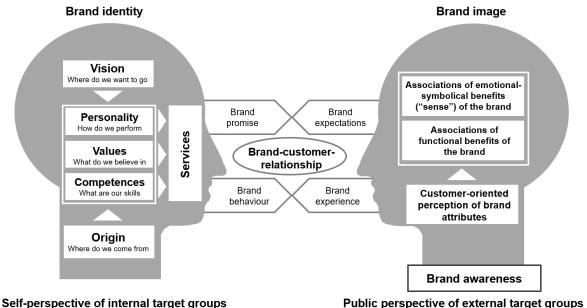

1st study: Brand awareness I four dimensional brand funnel

1. General overview of the study series Destination Brand

The functional benefit dimensions of destination brands are the subject of the second part of the Destination Brand study series, in which the theme competences attributed to each destination brand are measured.

The third part of the Destination Brand study series focuses on the emotional-symbolic benefit dimension of the destination brands. The study measures the attributes and characteristics ascribed to the destinations by the demand side. The importance of the emotional-symbolic benefit dimension has increased significantly in recent times: the convergence of products and services observable in the competition between destinations - as in many industries - manifests itself in particular through the constant convergence of the functional benefit dimension. This goes hand in hand with the decreasing possibilities for differentiation between destination brands - based on the functional benefit dimension. Instead, the emotional-symbolic field achieves priority importance for the differentiation, with the consequence that brands need to be additionally emotionalized in an identity-specific way⁶.

2nd study: Theme competence

3rd study: Attributes and characteristics

Concept of identity-based brand management

Source: adapted from Burmann, Halaszovich and Hemmann (2012), p. 74.

1. General overview of the study series Destination Brand – Brand value study

Aim Customer-oriented evaluation of the **brand value** of tourist destinations Awareness (supported and unsupported) Likeability Willingness to visit for future short trips and longer holiday trips within the next 3 years Research focus (and DB20: within the next 12 months) Visits in the past DB 20: Impact of the coronavirus pandemic on the interest to visit Target group- and competitor analysis Online survey in respective national language: quota sample (based on cross quota age/sex and regional origin) For all sub-Representative of the respective population aged 14-74 years living in private households (base for projection of absolute volumes) studies Comprehensive competitive comparison possibilities based on the relatively large destination pool Time comparison possibilities based on the consistent study design Survey design Specific per DESTINATION BRAND 12 DESTINATION DESTINATION DESTINATION BRAND sub-study DE | AT | CH | NL | DE DE DE | AT | CH | NL CN | FR | IT | ES | Source markets DE **UKIUS** Total number of 8,900 15,000 17,000 12,000 31,000 respondents Total number of 200** 141 160 172 76* destinations Themes /

1. General overview of the study series Destination Brand – Theme competence study

Aim

Customer-oriented evaluation of the theme competence of tourist destinations
 (≜ associations of the functional benefits of the destination brands)

Research focus

- General (i.e., regardless of a specific destination) interest in holiday activities
- Supported theme suitability per tourist destination (for 5 general themes and 5 specific themes)
- Theme suitability top of mind per tourist destination
- Target group- and competitor analysis

For all substudies

- Online survey in respective national language; quota sample (based on cross quota age/sex and regional origin)
- Representative of the respective population aged 14-74 years living in private households (base for projection of absolute volumes)
- Comprehensive competitive comparison possibilities based on the relatively large destination pool
- Time comparison possibilities based on the consistent study design

- **8 APPENDIX**

IMPRINT

Aim of research

- Study of the profile characteristics (module 1) of tourist destinations as well as
 spontaneous associations per destination (module 2) in the following source markets:
 - Germany (DE), Austria (AT), Switzerland (CH), Netherlands (NL), France (FR),
 Italy (IT), Spain (ES), United Kingdom (UK), USA (US), China (CN)

Research focus

- **General relevance** of characteristics when choosing a tourist destination
- Module 1: Supported evaluation of characteristics per tourist destination
 - Time comparison of key results for all tourist destinations in the source market
 Germany, which have been surveyed in the previous studies (e.g., DB17 or DB14)
 - Competitor analysis with all destinations surveyed per source market
- Module 2: **Spontaneous associations** per tourist destination
- Standard target group analysis based on:
 - sociodemographic criteria
 - the general (i.e., regardless of a specific destination) interest in holiday activities
 - the general (i.e., regardless of a specific destination) relevance of characteristics when choosing a tourist destination
- Additional target group analyses (chargeable) according to:
 - the "Sinus Milieus® Germany"* and the "Sinus-Meta-Milieus®"* by the SINUS-institute as well as
 - the "BeST types of holidaymakers"* by the FH Westküste

^{*} These options for target group definition exist exclusively for the source market Germany.

Survey design

- 166 destinations (several destinations were surveyed in more than one source market; distribution among source markets: DE = 151 | AT = 10 | CH = 10 | NL = 10 | CN = 10 | FR = 10 | IT = 10 | ES = 10 | UK = 10 | US = 10)
- **Total sample size:** 24,000; per destination: 1,000 (supported evaluation of characteristics and spontaneous associations); distribution among source markets: DE: 15,000 | all other source markets 1,000 each
- Online survey in the respective national language (remark: CH = German & French)
- Quota sample based on cross quota age/sex and regional origin
- Representative of the respective population aged 14-74 years living in private households (deviation only in the source market China*):

DE = 61.81 m people; AT = 6.59 m people; CH = 6.02 m people; NL = 12.78 m people; FR = 46.61 m people; IT = 45.51 m people; ES = 34.30 m people; UK = 47.95 m people; US = 246.50 m people

* Representative of the Ipsos panel members in China covering the following characteristics: Chinese-speaking urban population (including the top city categories "Tier 1-3" without Hongkong and Macau) aged 14-59 years with Internet access, which according to additional preceding filter questions shows an affinity to travel abroad.

Survey period

October / November 2022

As already described more in detail in chapter 1, scientifically-founded insights into the own profile are of crucial importance for tourist destinations in order to achieve a successful target-oriented strategic development of the destination marketing.

Against this background, the study Destination Brand 22 conducts a customer-oriented evaluation of profile characteristics (module 1) as well as a measurement of spontaneous associations (module 2) to a multitude of tourist destinations based on population-representative online surveys.

For the realisation of the study series Destination Brand, inspektour works together with a competent partner network, which offers a holistic set of methodological competences. The German Institute for Tourism Research of the FH Westküste (University of Applied Sciences) gives meaningful contribution as the scientific advisory board of the study. The database of the well-established study is assembled in cooperation with the market research company Ipsos.

While the predecessor profile studies in the years 2011, 2014 and 2017 already covered a comprehensive part of the German domestic tourist destinations, the study Destination Brand 19 widened the scope with regard to the measurement of the spontaneous associations (module 2) and additionally encompassed the four source markets Austria, Switzerland, the Netherlands and China. On top of the named source markets, the profile study Destination Brand 22 has also been conducted for the first time in France, Italy, Spain, the United Kingdom and the USA.

In total, 24,000 respondents were surveyed online in their respective national language in the course of the study Destination Brand 22. The sample sizes per source market are as follows: DE: n = 15,000 | all other source markets each: n = 1,000. The field work was carried out, managed and controlled by the Ipsos GmbH. In this process, in each source market (sub-) samples of 1,000 respondents were used. Each of these (sub-) samples is representative of the respective population aged 14-74 years living in private households (under application of a cross quota "age/sex" and an independent quota "regional origin").

Competent partner network

Survey in the source markets (DE | AT | CH | NL | CN | FR | IT | ES | UK | US)

Population-representative online surveys

Only the survey in the source market China constitutes a deviation from the previous representativeness statement. It is representative of the Ipsos panel members in China covering the following characteristics: Chinese-speaking urban population (including the top city categories "Tier 1-3" without Hongkong and Macau) aged 14-59 years with Internet access. In the main part of the survey on destination-specific questions regarding the general relevance of characteristics for destination selection and the supported evaluation of characteristics per tourist destination in the source market China, only those interviewees took part, who are considered to have an "affinity to travel abroad" according to additional preceding filter questions (n = 1,000). For this purpose, the respondents had to fulfill at least one of the following two conditions:

- Condition 1: have travelled abroad in the last 3 years (with at least 1 overnight stay) and / or
- Condition 2: hold a valid passport (or have applied for it or plan to apply for it within the next 3 years) and are willing to undertake a short trip (with 1 - 3 overnight stays) and / or a longer holiday trip (with 4 or more overnight stays) abroad within the next 3 years

Taking up the general approach of strategic management, the profile study makes it possible to conduct a threedimensional analysis of the competitive situation (see the following figure). Thereby, the general relevance for destination selection (1st analysis dimension "demand"; see chapters 3.1 + 4), the evaluation of profile characteristics of the destination (2nd analysis dimension "supply"; see chapters 3.2 + 5) as well as the performance of the destination compared to the competitors (3rd dimension "competition"; see chapters 3.3 + 6) are comprehensively analysed. The queried designation of Navarre for Dutch respondents was "De Noord-Spaanse regio Navarre".

In the following, the key features of the three analysis dimensions will be described briefly.

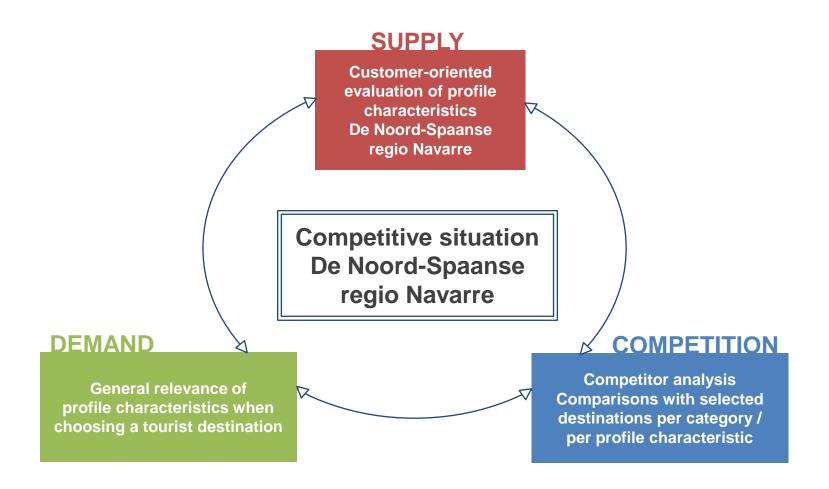

Representativeness in the source market China

Three-dimensional analysis of the competitive situation

2.1 Methods of the profile study Destination Brand 22

Three-dimensional analysis of the competitive situation

2.1.1 Analysis dimension 1: Demand

In accordance with the predecessor profile studies, the recent edition Destination Brand 22 also centres on the measurement of the general (i.e., regardless of a specific destination) relevance of characteristics for destination selection among the respective represented population (see chapters 3.1 + 4). The general relevance is measured on the basis of the proportion of the top-two-box on a scale from "5 = very relevant" to "1 = not at all relevant".

In the study Destination Brand 22, the general relevance was surveyed for 49 profile characteristics in an uniform manner for all ten source markets (for a detailed overview of the characteristics taken into account, see chapter 2.2).

The addition or omission, as well as some minor formulation adjustments, of individual characteristics compared to the predecessor studies Destination Brand 17-14-11 is based on a comprehensive review of the current status of the previous pool of profile characteristics on the part of inspektour. In the new compilation of the pool of characteristics, interim trend developments, the expansion of the study to include international source markets and the associated change in the relevance of individual characteristics at the international level were also taken into account. Furthermore, in Destination Brand 22, as in every edition of the profile study, individual additional profile characteristics have found their way into the pool of characteristics of the current study by means of the individual selection option for the participating clients in the context of their commissioning.

General relevance of characteristics for destination selection

49 profile characteristics surveyed in an uniform manner for all ten source markets

> Additional explanation on the composition of the considered pool of characteristics

2.1.2 Analysis dimension 2: Supply

This second central analysis dimension of Destination Brand 22 focuses on the question, to which extend the represented population considers a set of at least 10 different profile characteristics to be applicable to the respective tourist destination. This set consists of 5 general characteristics as well as most commonly 5 additional specific characteristics.

The general characteristics "attractive", "authentic / genuine", "hospitable", "offering a lot of variety" and "sustainable" were uniformly examined for all considered destinations independently of the source market. In the case of the specific characteristics, 5 up to 10 individually relevant characteristics could be selected by the responsible authority for the respective destination based on a pre-defined pool of characteristics.

The evaluation of profile characteristics was carried out by those respondents to whom the respective destination is known - even if only be name ("supported evaluation of profile characteristics"). The attributed applicability of profile characteristics is measured on the basis of the proportion of the top-two-box on a scale from "5 = completely applicable" to "1 = not at all applicable".

The number of respondents for all considered destinations with regard to the evaluation of profile characteristics is 1,000. This comprehensive sample size generally permits the conduction of more detailed and statistically secured analyses. Among others, this encompasses a differentiation of the evaluated profile characteristics by the following highly relevant sub-groups (see chapter 3.2):

- "affine to the characteristic": Respondents for whom the respective characteristic is generally relevant when choosing a destination for a holiday trip with at least one overnight stay (top-two-box value)
- "visitors in the past": Respondents who have already holidayed in the tourist destination (with at least one overnight stay)

In the case of international destinations (from the perspective of the respective source market), further analyses for the high potential sub-group of respondents with a "distinct intention to travel abroad" need to be additionally emphasized. This group of respondents definitely intends to undertake a short trip (with 1 – 3 overnight stays) and / or a longer holiday trip (with 4 or more overnight stays) abroad within the next three years.

For each destination: applicability assessment regarding 10 characteristics

Differentiation by highly relevant sub-groups

Analysis of the sub-group "distinct intention to travel abroad"

2.1.2 Analysis dimension 2: Supply

Furthermore, in the course of the standard target group analysis of the individual reports (see chapter 5.3), the evaluation of the profile characteristics is differentiated by up to 6 individually selected target groups. They can be defined based on sociodemographic criteria, the general (i.e., regardless of a specific destination) interest in various holiday activities, the general (i.e., regardless of a specific destination) relevance of various characteristics for destination selection, the intention of the respondents to travel abroad / domestically as well as a combination of these aspects.

Concerning the source market Germany, additional comprehensive options of the target group analysis can be ordered comprising the following renowned target group segmentations:

- the "Sinus Milieus® Germany" and "Sinus-Meta-Milieus®" which are based on people's attitudes and orientations, values, lifestyles and life goals as well as social backgrounds and positions
- the "BeST types of holiday makers" which are based on the beliefs and benefit expectations of the German holiday makers (this typology was developed by the German Institute for Tourism Research at the FH Westküste in the year 2020)

For the analysis of the tourist destination De Noord-Spaanse regio Navarre in the source market Netherlands, Dirección General de Turismo, Comercio y Consumo Navarra chose the target group definitions shown in the introduction to chapter 5 as part of the standard target group analysis.

In addition to the target group analysis, the report includes further bivariate evaluations (see chapter 5.2), in which the evaluated profile characteristics was differentiated according to the following eight sociodemographic criteria: sex, age groups, formal education, household size, number of children under 14 years of age in the household, net household income, town size and regional origin. These evaluations provide a comprehensive basis for identifying further attractive market potentials.

Standard target group analysis

Additional comprehensive options of the target group analysis in the source market Germany

Additional differentiation according to 8 socio-demographic criteria

2.1.3 Analysis dimension 3: Competition

In total, 166 different tourist destinations were included in the survey of the study Destination Brand 22 running in the period of October and November 2022 based on identical methods compared to the predecessor studies. The selection of the destinations to be considered was done by the inspektour (international) GmbH.

Since some of the destinations were surveyed in two or more source markets, the ten source market-specific destination pools cover a higher number of tourist destinations in total. Their distribution is as follows: DE = 151 | all other source markets each = 10.

As a unique feature of the study series Destination Brand, the substantial destination pool facilitates the conduction of considerable comparisons with the competitive environment. In this context, a comprehensive competitor analysis representing a central component of this report was carried out. The comparison with the competitors was made on the basis of "all respondents", the respondents being "affine to the characteristic" as well as in the case of international destinations the respondents with a "distinct intention to travel abroad" (single overview: see chapter 3.3 | extensive detailed rankings of all considered destinations based on "all respondents": see chapter 6).

The methodological explanations conclude with the following two additional remarks:

- Please note that any deviations of the sum of added percent values are due to rounding differences.
- For further details, please refer to the appendix, which includes among others some descriptive reading examples as well as a glossary of the most important terms.

In total: 166 different tourist destinations

Comprehensive competitor analysis

Appendix: Descriptive reading examples

IMPRINT

7.1 inspektour (international) GmbH - Tourism and market research

The study series Destination Brand is carried out under the project leadership of inspektour. Our goal is to realise a practise-oriented, holistic expansion and further development of the study series.

As a private-sector consultancy for practise-oriented development and concepts in leisure tourism as well as in regional development, we have set ourselves the goal of providing local authorities, institutions or companies with advice. We are taking on challenges with our partners and constantly work towards breaking new ground in the creation of innovative and future-oriented solutions.

Since 2001, we have been researching, analysing and designing content and providing support in the implementation of partial or overall concepts, particularly in the fields of destination and leisure management, market research, nature and environmental management as well as city and regional marketing and management. inspektour has successfully supervised and carried out hundreds of projects across Germany and increasingly operates on an international level. Since 2009, we have been certified in accordance with Service-Quality Germany.

In addition to a great deal of empathy and commitment, inspektour's work is characterised by a high level of practical orientation and an implementation approach as well as the involvement of all relevant stakeholders in achieving a generally accepted project result.

The 17 permanent employees of inspektour have a broad scientific background – among others Dipl. Economics (FH), Dipl. Geography, Dipl. Engineering, Dipl. Culture Management, Dipl. Tourism Management, Dipl. Traffic Science, Master's in Eco-tourism (M.Sc.), Master's in International Tourism Management (MA), Master's in Sports Tourism and Recreation Management (M.Sc.) – and make the provision of a well-founded examination of different themes possible. A long-standing and intensive scientific and operational exchange with the FH Westküste (University of Applied Sciences) and the German Institute for Tourism Research in Heide (Holstein) is fostered through joint projects and lectures.

7.2 German Institute for Tourism Research of the FH Westküste

Applied, empirical tourism research as a task

The German Institute for Tourism Research was founded on June 12, 2020 as an In-Institute at the West Coast University of Applied Sciences. However, the roots of the new institute go back much further. It emerged from the Institute for Management and Tourism (IMT), which since its founding in 2006 - measured by the number of employees - developed into the largest In-Institute in tourism at a German university and thus became a "lighthouse" for the research and study location Heide (Holst.). The rededication to the German Institute for Tourism Research in 2020 took this significance and the many years of experience into account.

In its following and interconnected core areas, the German Institute for Tourism Research is Germany's first contact for applied, empirical tourism research:

1. Travel behavior

Consideration of travel as well as its preparation and follow-up under political, economic, social, ecological and technical influences with a focus on people as well as tourism demand

2. Effects of travel on society, ecology and economy

Consideration of the social, environmental as well as economic effects resulting from travel demand. In addition to aspects such as tourism acceptance or value chains, the effects of travel behavior on the environment and the necessary derivations are also examined.

3. Strategic development options in destinations and institutions

Supporting tourism management in strategic decision-making through insights from travel behavior and the effects of tourism demand

Practical relevance, independence and neutrality characterize the work of the institute. It conducts interdisciplinary research and bundles scientific competencies from various disciplines under its roof. The work of the institute is additionally enriched by members from other scientific fields as well as an advisory board. Thus, the investigated issues are comprehensively considered and classified; the research results are published in publications. As director of the German Institute for Tourism Research, Professor Dr. Bernd Eisenstein ensures the continuation of the successful work of the IMT, which he founded and headed.

8.1 Reading examples - Demand: General relevance

General relevance for destination selection of the general characteristics

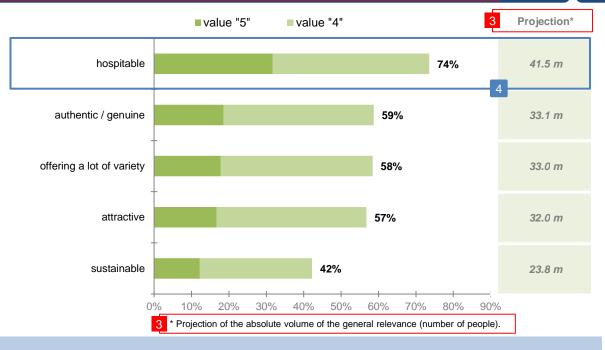

> Just as people have certain character traits, tourist destinations can also be described using certain characteristics. How relevant are the following characteristics when you <u>choose a tourist destination</u> for a holiday trip with at least one overnight stay <u>in general</u> (i.e., regardless of a specific tourist destination)?

> Top-two-box on a scale from "5 = very relevant" to "1 = not at all relevant" (in % of respondents)

■ General characteristics

Source market: Source market XY Base: All respondents

Number of respondents: 17,000

<u>Central question</u>: How high is the **general (i.e., regardless of a specific destination) relevance of the respective characteristics** (here the general characteristics) for the represented population when choosing a tourist destination? – Reading example "hospitable"

- For 74% of the represented population, the characteristic "hospitable" is generally (i.e., regardless of a specific destination) relevant when choosing a tourist destination for a holiday trip with at least one overnight stay.
 - This corresponds to a total of 41.5 m people aged 14-74 living in private households (see column on the right).

1

Values are expressed as **top-two-box values**, i.e., the percentage refers to all respondents that answered with "5 = very relevant" or value "4" for the respective characteristic.

In this example, all respondents are taken into consideration. In the study Destination Brand 22, a total of 1,000 to 15,000 people were surveyed online per source market about the general (i.e., regardless of a specific tourist destination) relevance of the respective characteristics when choosing a tourist destination.

The **projection** refers to the population represented in the study (usually 14-74 years), which totals the following volume per source market:

DE = 61.81 m people; AT = 6.59 m people; CH = 6.02 m people; NL = 12.78 m people;

FR = 46.61 m people; IT = 45.51 m people;

ES = 34.30 m people; UK = 47.95 m people;

US = 246.50 m people.

8.1 Reading examples - Supply: Supported evaluation of characteristics

Supported evaluation of the general characteristics

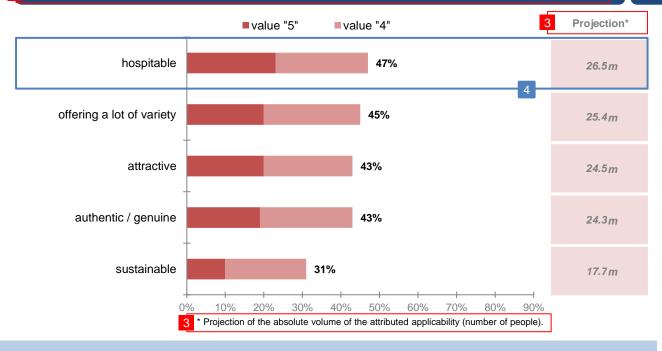

> Just as people have certain character traits, tourist destinations can also be described using certain characteristics. Please indicate to what extent the following characteristics are applicable to the following international tourist destination?

> Top-two-box on a scale from "5 = completely applicable" to "1 = not at all applicable" (in % of respondents)

■ Destination XY

Source market: Source market XY Base: All respondents

Number of respondents: 1,000

<u>Central question</u>: To what extent are the **considered characteristics applicable to Destination XY** (here the five pre-defined general characteristics)? – Reading example "hospitable"

- 4 ▶ 47% of the represented population rate Destination XY as "hospitable" (see top-two-box).
 - ▶ This corresponds to a total of 26.5 m people aged 14-74 living in private households (see column on the right).

1

Values are expressed as **top-two-box values**, i.e., the percentage refers to all respondents that answered the question with "5 = completely applicable" or the value "4".

2

In this example, all respondents are considered for the supported evaluation of characteristics. In total, 24,000 people were surveyed online in the study Destination Brand 22. Various representative sub-samples were used to achieve a sample size of 1,000 per tourist destination.

The **projection** refers to the population represented in the study (usually 14-74 years), which totals the following volume per source market:

DE = 61.81 m people; AT = 6.59 m people;

CH = 6.02 m people; NL = 12.78 m people;

FR = 46.61 m people; IT = 45.51 m people;

ES = 34.30 m people; UK = 47.95 m people;

US = 246.50 m people.

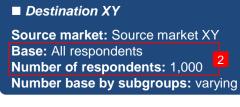

8.1 Reading examples - Supply: Supported evaluation of characteristics by subgroups

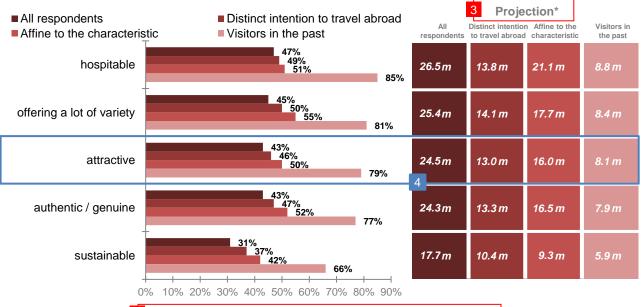

Supported evaluation of the general characteristics

> Just as people have certain character traits, tourist destinations can also be described using certain characteristics. Please indicate to what extent the following characteristics are applicable to the following international tourist destination?

> Top-two-box on a scale from "5 = completely applicable" to "1 = not at all applicable" (in % of respondents)

Projection of the absolute volume of the attributed applicability (number of people).

Central question: To what extent are the considered characteristics applicable to Destination XY from the perspective of the different subgroups (here the five pre-defined general characteristics)? — Reading example "attractive"

- ▶ 43% of the represented population rate Destination XY as "attractive" (see the dark red bar at the top).
- ▶ In comparison to the overall represented population, the subgroups "distinct intention to travel abroad" (46%) and "affine to the characteristic" (50%) attribute a higher attractivity to Destination XY (see the two red bars in the middle).
- ▶ Moreover, Destination XY receives the highest attractivity rating by the subgroup "visitors in the past" (79%, see the light red bar below).
- In addition, the table on the right hand side displays the projection of the absolute volume of the attributed applicability for each subgroup.

Values are expressed as top-two-box values, i.e., the percentage refers to all respondents that answered the question with "5 = completely applicable" or the value "4".

The supported evaluation of characteristics is calculated based on the subgroups "distinct intention to travel abroad" (respondents who definitely intend to spend a short trip and / or a longer holiday trip abroad within the next 3 years), "affine to the characteristic" (respondents for whom the respective characteristic is generally relevant when choosing a tourist destination for a holiday trip with at least one overnight stay) as well as "visitors in the past" (respondents who have already holidayed in the tourist destination with at least one overnight stay).

The **projection** refers to the population represented in the study (usually 14-74 years), which totals the following volume per source market:

DE = 61.81 m people; AT = 6.59 m people;

CH = 6.02 m people; NL = 12.78 m people; FR = 46.61 m people; IT = 45.51 m people;

ES = 34.30 m people; UK = 47.95 m people;

US = 246.50 m people.

8.1 Reading examples – Competition: Comparison with competitors

DESTINATION BRAND 22	Ce	Category: All considered destinations							
Destination XY	Number of			Base: espondents		Base: Affine to the characteristic			
(N=1,000)	destinations in category	ow	n value	mean	rank	ow	n value	mean	rank
		in %	projection*		Tank	in %	projection*	mean	Tank
offering a lot of variety	6	45%	25.4 m	27%	12.	55%	17.7 m	32%	11.
attractive	U	43%	24.5 m	29%	27.	50%	16.0 m	35%	33.
authentic / genuine	170	43%	24.3 m	32%	32.	52%	16.5 m	39%	36.
hospitable		47%	26.5 m	31%	18.	51%	21.1 m	36%	26.
sustainable		31%	17.7 m	23%	22.	42%	9.3 m	32%	26.

^{*} Projection of the absolute volume of the attributed applicability (number of people).

▶ Note: Last survey taken into consideration in October / November 2022

<u>Central question</u>: How does Destination XY perform in comparison with competitors regarding the supported evaluation of characteristics in the category "all considered destinations"? – Reading example "attractive"

- ▶ 43% of the representative population rate destination XY as "attractive" (see column "own value in %"). Compared to the average of all surveyed destinations of 29% (see column "mean"), Destination XY positions itself clearly above average and ranks 27th out of 170 (see column "rank") in the category "all considered destinations" (see left part of the table, base "all respondents").
- ▶ The right part of the table additionally displays the results based on the subgroup "affine to the characteristic". Even though Destination XY receives a higher evaluation (50%) for the profile characteristic "attractive" by the respondents with affinity to the characteristic (see column "own value in %"), the achieved rank (33rd out of 170; see column "rank") is a bit lower.

The results for the supported evaluation of characteristics can be compared based on different categories of competitors. In this example, the results refer to the category "all considered destinations".

This overview is based on "all respondents" and "respondents with affinity to the characteristic".

In this example, a total of 170 tourist destinations were investigated. In the case of the specific characteristics, the number of considered destinations varies, which needs to be taken into account in the interpretation of the results.

The rankings are based on the top-two-box values of the considered tourist destinations in the respective category. Only the values of Destination XY are displayed here (column own value).

The average of the category is calculated as the arithmetic mean of the top-two-box values of all destinations included in this category.

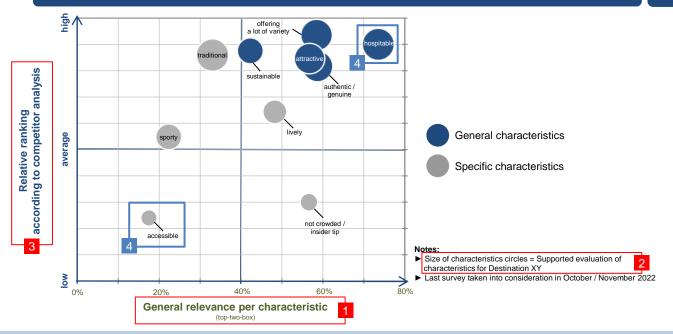

Quadrant analysis Destination XY

> Category for relative ranking according to competitor analysis:
All considered destinations (up to 170 tourist destinations per characteristic)

<u>Central question</u>: How can the **key results of the three-dimensional competitor analysis** on the evaluation of characteristics of Destination XY be summarised? – Reading example "hospitable" & "accessible"

▶ The attribute "hospitable" is characterised by a very high general relevance for destination selection (see position far to the right on the X-axis). Furthermore, the characteristic "hospitable" is evaluated as highly applicable to Destination XY (see large "characteristic circle"), which leads to a ranking clearly above-average of Destination XY in the comparison of competitors (see position in the upper area on the Y-axis).

▶ In contrast, the general relevance for destination selection of the characteristic "accessible" is significantly lower (see position in the left area on the X-axis). Furthermore, Destination XY only receives a low rating for this attribute (see small "characteristic circle") and thus achieves a ranking clearly below-average in the comparison of competitors (see position in the lower area of the Y-axis).

■ Destination XY

Source market: Source market XY

Base: All respondents

Number of respondents: 1,000

1

"Demand": The general relevance per characteristic is expressed by the position of the circle on the X-axis (horizontal). The greater the relevance of the respective characteristic among the represented population when choosing a tourist destination, the further to the right the characteristic is placed on the axis.

2

"Supply": The supported evaluation of characteristics of Destination XY is represented by the size of the respective "characteristic circles". The larger the "characteristic circle", the more the respective characteristic is rated as applicable to the Destination XY.

3

"Competition": The relative ranking in the competitor analysis of Destination XY in the category "all considered destinations per characteristic" is illustrated by the position of the respective characteristic on the Y-axis (vertical). The better Destination XY performs in the competitive comparison, the higher the respective characteristic is placed in the quadrant.

8.1 Reading examples – Supply: Supported evaluation of characteristics – Sociodemographic differentiation

Supported evaluation of the general characteristics

> Just as people have certain character traits, tourist destinations can also be described using certain characteristics. Please indicate to what extent the following characteristics are applicable to the following international tourist destination?

1 > Top-two-box on a scale from "5 = completely applicable" to "1 = not at all applicable" (in % of respondents)

n	4:	74-0	V	w
Des			III X	Υ.

Source market: Source market XY Sociodemography: Age group 2

Base: All respondents

Number of respondents: 1,000

		Age group						4 Significance*	
General characteristics	total	14-24 y.	25-34 y.	35-44 y.	45-54 y.	55-64 y.	65-74 y.	(Kruskal- Wallis-test)	
attractive	43%	27%	30%	42%	45%	46%	54%	sig.	
authentic / genuine	43%	25%	29%	43%	45%	47%	57%	sig.	
hospitable	47%	40%	44%	47%	51%	53%	55%	n.s.	
offering a lot of variety	45%	37%	44%	47%	49%	50%	52%	sig.	
sustainable	31%	20%	22%	27%	30%	35%	45%	sig.	

* Level of significance min. 0.05 (abbreviations: sig. = significant / n.s. = not significant, for further information see glossary).

<u>Central question</u>: What are the **differences between age groups** with regard to the evaluation of characteristics of Destination XY? – Reading example: "attractive"

- The results by age group are among others significant in the case of the characteristic "attractive" (see column "Significance"). Subsequently, the results can be applied to the general population.
 - ▶ While the applicability rating by the "14-24 year-olds" (27%) and the "25-34 year-olds" (30%) of the characteristic "attractive" is below average of all respondents (43%), the "65-74 year-olds" (54%) give the highest rating for Destination XY.

1

Values are expressed as **top-two-box values**, i.e., the percentage refers to all respondents that answered the question with "5 = completely applicable" or the value "4".

2

In addition to the univariate evaluation results, several **bivariate analyses** are part of the report. Among others, the attributed applicability achieved is differentiated according to **eight sociodemographic criteria**. This example depicts the criterion "age group".

3

In case of the criterion "age group", the approval rates can be differentiated by six age cohorts.

4

If the results of the bivariate analyses are significant, the observed differences between the different categories (here "age groups") are statistically secured and can be applied to the overall population with a confidence probability of at least 95%. If the results are not significant, the confidence probability is below 95%.

8.1 Reading examples – Supply: Supported evaluation of characteristics – Standard target group analysis

Supported evaluation of the characteristic: "offering a lot of variety"

> Just as people have certain character traits, tourist destinations can also be described using certain characteristics. Please indicate to what extent the following characteristics are applicable to the following international tourist destination?

1 > Top-two-box on a scale from "5 = completely applicable" to "1 = not at all applicable" (in % of respondents)

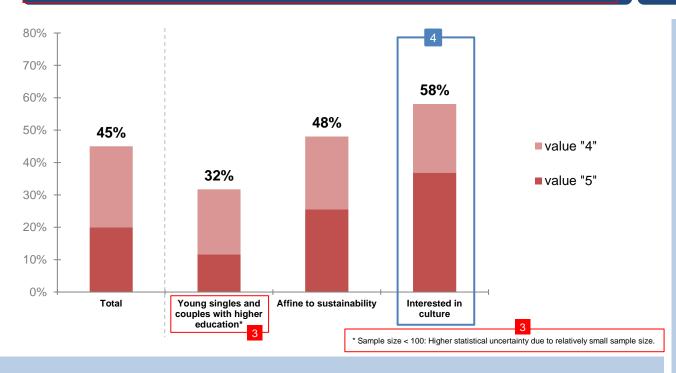

■ Destination XY

Source market: Source market XY Segmentation: Target groups 2

Base: All respondents

Number of respondents: 1,000

<u>Central question</u>: Among which target group does Destination XY achieve the highest rating regarding the characteristic "offering a lot of variety"?

- ▶ In this example the considered target groups are "Young singles and couples with higher education", "Affine to sustainability" and "Interested in culture".
- ▶ Among the three target groups, the respondents being "Interested in culture" give Destination XY the highest applicability rating regarding the characteristic "offering a lot of variety" (58%). Their approval rate is clearly above the average of all respondents (45%).

Values are expressed as **top-two-box values**, i.e., the percentage refers to all respondents that answered the question with "5 = completely applicable" or the value "4".

In addition to the univariate evaluation results. several bivariate analyses are part of the report. Among others, the evaluation of the profile characteristics can be differentiated by individually selected target groups. In the case of the standard target group analysis, the target groups can be defined based on sociodemographic criteria, the general interest in various holiday activities and/or the general relevance of various profile characteristics for destination selection. Concerning the source market Germany, additional comprehensive options of the target group analysis comprise a differentiation by the "Sinus Milieus®" by the SINUS-institute as well as the "BeST types of holiday makers" by the FH Westküste.

In the case of the target group "Young singles and couples with higher education", the number of cases is below 100, which means that a higher level of statistical uncertainty needs to be taken into consideration.

8.2 Glossary – Content of the profile study

Content of the profile study	
General relevance of characteristics (module 1)	Share of the represented population for whom the respective characteristic is generally relevant when choosing a tourist destination for a holiday trip with at least one overnight stay (responses of the top-two-box on a rating scale for the assessment of the general relevance of characteristics)
Supported evaluation of characteristics (module 1)	Share of the represented population that rates the respective characteristic as applicable for the destination in question (responses of the top-two-box on a rating scale for the supported evaluation of characteristics)
Spontaneous associations (module 2)	Share of the represented population that spontaneously (i.e., without being provided answer options) associates certain ideas, attributes respectively characteristics with the tourist destination
Subgroups	
Characteristic-attributors	Respondents who rate the respective characteristic as applicable for the destination in question (measured using the top-two-box value)
Characteristic-attributors Affine to the characteristic	· · · · · · · · · · · · · · · · · · ·
	(measured using the top-two-box value) Respondents for whom the respective characteristic is generally relevant when choosing a tourist

8.2 Glossary – *Methods*

Methods

Representativeness

	the total population. In a stricter sense, a sample is representative if all the individuals in the population had the same possibility of becoming part of that sample.
Population	A population is a finite set of statistical units that are of interest for primary research. As it is often not possible to survey the total population, a sample is usually selected (partial survey) to determine the opinion of the population. In case of small populations, a complete survey among all individuals belonging to the population might be possible.
Sample	A sample is a selection of people or objects that provides representative information on behalf of a population. The responses given by the sample can be applied for the entire population.
Quota sample	The quota sample is a systematic selection procedure. In the case of quota samples, the selection of the representative sample to be surveyed is not left to chance, but the selection is made on the basis of so-called control variables. Control variables are usually demographic data such as gender, age, income, level of education, etc. The knowledge of the composition of a population with regard to these control variables is usually based on other statistical surveys, such as official statistics. The selection of statistical units that hold the defined control variables (i.e., survey respondents), is not random, but is determined by a responsible party.
Confidence level / probability	The confidence level indicates the probability that the value of a statistical parameter (for example, a mean) from a sample survey is appropriate for the population. Confidence levels must be set for a survey – they form the basis not only for the error tolerance but also for the necessary size of a sample. Surveys in the social sciences frequently use confidence levels of 90, 95 or 99 percent. If the confidence

Is used to indicate that a sample reflects all (essential) characteristics of a population and thus mirrors

level is 95 percent, this means that a statistically determined value from the sample survey is 95 percent

likely to be within the calculated confidence interval for the population as well.

130

8.2 Glossary – *Methods*

Level of significance	Used to test the significance of a null hypothesis. The level of significance represents the upper limit of the margin of error and is in the social sciences generally at 5%. The results of a hypothesis test indicate that there is a probability of 95% that a measured correlation from within the sample is also applicable to the overall population. The remaining 5% mean that there is still a probability that the results are generated by chance and a statistical correlation is mistakenly assumed.
Significant	A tested correlation between variables can be identified as significant, if the level of significance is within the defined level and does not exceed 95% probability. Thus, the assumed hypothesis and statistical correlation is applicable to the population. In short, a measured correlation between two variables did not randomly appear in the sample, but also applies to the population. To check this, a hypothesis test is carried out.
Hypothesis test / test of significance	Hypothesis tests (including statistical tests or tests of significance) are used to confirm or reject constructed hypotheses based on empirical observations. For example, it is assumed that the average age of the population is increasing over time. The hypothesis to be proven "the population is aging" is referred to as an alternative hypothesis, the previous opinion "the average age of the population is always the same" is referred to as the null hypothesis. The aim of the hypothesis test is to reject the null hypothesis and thus confirm the alternative hypothesis.

8.2 Glossary – *Measurement categories*

Measurement categories						
Percentage of responses	pe of responses This means that the number of responses is used to calculate the percentage value.					
Percentage of cases	This means that the number of respondents is used to calculate the percentage value. For multip response options, the percentage may be greater than 100 percent.					
Top-two-box (value)	Sum of the two highest values of a rating scale, percentage					
Change	Rate of change compared to a previous period, percentage points					
Units, symbols						
%, %-p.	Percentage, percentage points					
mean	Average, (corresponds to arithmetic mean)

8.3 Margin of error

Explanation

Using the table on the previous chart, it is possible to calculate a (two-sided) confidence interval based on a proportion of a given characteristic obtained from a sample, in which the true value of the unit in the population as a whole is located.

Example: 1,000 people are randomly selected from the registration index of a city. Based on the birthplace of these individuals, it can be stated that 20% were born in another location. Based on this sample, the proportion of the city's population that was born in another place can be estimated. The estimation should be made with the utmost certainty. A margin of error of 5% is agreed upon in this estimation.

The table is divided into a standard gray-and-white area and an orange-and-white case-specific area. In the grey-and-white area, the confidence intervals for variances are calculated for 19 unit values (5%, ..., 95%) and 12 possible sample sizes (n = 100, ..., n = 10,000). These variances are deducted from the estimated value or calculated accordingly to obtain the desired confidence interval.

For the example given above, the table shows a variance of 2.48 with a confidence level of 95%. This means that the true proportion of people born elsewhere, with a probability of 95%, is between 20% -2.48% = 17.52% and 20% + 2.48% = 22.48%.

In the orange-and-white area, the sample size is also highlighted in terms of the analysis of the supported evaluation of profile characteristics to the tourist destination "De Noord-Spaanse regio Navarre" in the source market Netherlands of 1,000. The table below specifies the fluctuation intervals for the 19 predefined values that result from the defined confidence level of 95%. In addition, the limits of the confidence interval for the respective unit value are also calculated here.

Outline

- 1 GENERAL OVERVIEW OF THE STUDY SERIES DESTINATION BRAND
- 2 DESIGN OF THE PROFILE STUDY DESTINATION BRAND 22
- 3 OVERVIEW OF KEY RESULTS: THREE-DIMENSIONAL COMPETITOR ANALYSIS
- 4 DEMAND: GENERAL RELEVANCE PER PROFILE CHARACTERISTIC IN DETAIL
- 5 SUPPLY: SUPPORTED EVALUATION OF PROFILE CHARACTERISTICS IN DETAIL
- 6 COMPETITION: COMPARISON WITH COMPETITORS PER PROFILE CHARACTERISTIC

8.4 List of literature regarding the general overview of the study series Destination Brand

The given overview in chapter 1 represents an excerpt of the following article (slightly modified):

Eisenstein, B., Koch, A., Trimborn, P. and Müller, S. (2017): Die DestinationBrand-Studienreihe – Basisinformationen zur Markenführung von Destinationen.- In: Eisenstein, B. (ed.) (2017): Marktforschung für Destinationen. Grundlagen – Instrumente – Praxisbeispiele.- Berlin, pp. 267-283.

Notes

- ¹ See Meffert, Burmann and Kirchgeorg (2015), p. 329; Esch (2014), p. 79; Meffert and Burmann (2013), p. 31; Burmann, Halaszovich and Hemmann (2012), pp. 27.
- ² Brand image is defined here as "ein in der Psyche relevanter externer Zielgruppen fest verankertes, verdichtetes, wertendes Vorstellungsbild" (Burmann, Halaszovich and Hemmann (2012), p. 364).
- ³ The term brand is understood here as "ein Nutzenbündel mit spezifischen Merkmalen [...], die dafür sorgen, dass sich dieses Nutzenbündel gegenüber anderen Nutzenbündeln, welche dieselben Basisbedürfnisse erfüllen, aus Sicht relevanter Zielgruppen nachhaltig differenziert." (Burmann, Blinda and Nitschke (2003), p. 3 based on Keller (2003), p. 2.)
- ⁴ See Burmann, Meffert and Feddersen (2007), p. 11.
- ⁵ See Burmann, Schade and Müller (2014), p. 282.
- ⁶ See Esch and Möll (2009), p. 30.
